

Why Vaccinate Children and Teens Against COVID-19

WHAT YOU NEED TO KNOW

- COVID-19 can make children and teens of any age very sick and can sometimes require treatment in a hospital. Some children and teens have even died from COVID-19.
- The benefit of COVID-19 vaccines, like other vaccines, is that those vaccinated get protection without risking the potentially serious consequences of getting sick with COVID-19.
- Help protect children from severe disease, hospitalization, or death by getting them vaccinated against COVID-19.

Help Protect Your Child

COVID-19 vaccination is an important tool to help protect everyone 6 months and older from COVID-19 and its complications.

Getting children and teens vaccinated against COVID-19 can help keep them from getting really sick if they do get COVID-19. Vaccinating children can also help relieve the strain on families by providing greater confidence in children participating in childcare, school, and other activities.

Impact of COVID-19 in Children and Teens

Just like adults, children and teens of all ages can:

- Get very sick from COVID-19
- Have both short- and long-term health problems
- Spread COVID-19 to others

There is no way to tell in advance how children or teens will be affected by COVID-19. Those with underlying medical conditions or who have a weakened immune system are more likely to get severely ill from COVID-19.

Some examples of conditions that can make children more likely to get severe COVID-19 include:

- Asthma or chronic lung disease
- Diabetes
- Obesity
- Sickle cell disease

However, those without underlying medical conditions can also experience severe illness and be hospitalized. In fact, approximately 1 in 3 children younger than 18 years old hospitalized with COVID-19 have no underlying conditions.

Why Vaccinate Children and Teens Against COVID-19

Vaccination Helps Prevent Multisystem Inflammatory Syndrome in Children (MIS-C) Associated with COVID-19

Children and teens who get COVID-19 can develop serious complications like multisystem inflammatory syndrome in children (MIS-C). MIS-C is a condition where different body parts become inflamed, including the heart, lungs, kidneys, brain, skin, eyes, or gastrointestinal organs.

Since the beginning of the pandemic, thousands of cases of MIS-C have been reported. Children ages 5 through 11 years are most frequently affected by MIS-C, with almost half of all reported cases occurring in children in this age group. In addition, Hispanic or Latino and non-Hispanic Black children are disproportionately affected by MIS-C.

COVID-19 vaccination reduced the likelihood of MIS-C in children ages 12 through 18 years by 91%. Data from July to December 2021 show that 95% of children ages 12 through 18 years hospitalized with MIS-C were not vaccinated. CDC is collecting data on how well COVID-19 vaccination works against MIS-C in younger children. As more children under 12 years old get vaccinated, CDC will be able to analyze and share those data.

Children and Teens Can Experience Ongoing Health Problems after COVID-19

After getting COVID-19, children and teens can also experience a wide range of new, returning, or ongoing health problems. These include physical and mental health complications that may occur four or more weeks after initial infection. These complications can appear after mild or severe COVID-19, or after MIS-C.

Symptoms that children and teens may experience after COVID-19 are like those seen in adults and include:

- Fatigue
- Cough
- Muscle and joint pain
- Headache
- Trouble falling or staying asleep
- Trouble concentrating

Post-COVID symptoms can affect quality of life, including:

- Limitations in physical activity
- Feeling distressed about symptoms
- Mental health challenges
- Decreased school or daycare attendance
- Missed opportunities for participation in sports, playdates, or other activities
